Week 9 Platform as a Service (PaaS)

Mastering Cloud Computing Coleman Kane

(based on material by Paul Talaga)

Complexity of Infrastructure as a Service (laaS)

Need to build/install/manage OS stack

Need to be "Always on" - inefficient

Server deployment is larger attack surface, security concerns

Varying solutions / stacks - highly variable

Containers Can Help

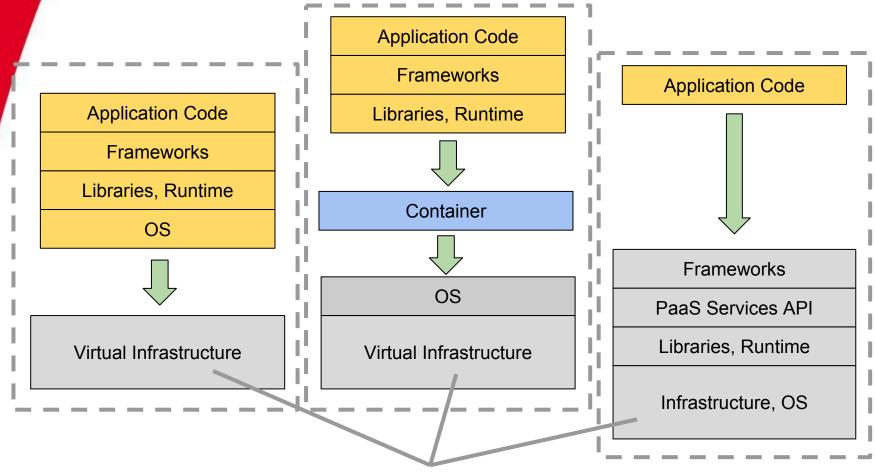

Containers provide "stand alone" app deployment arenas

Python / PHP / Java application:

- Create image with base Tomcat, Flask, etc. frameworks
- Define standard Python/Java/etc. app deployment path
- Normalized/Standardized build

laaS -> Container -> PaaS

Managed/supplied by "cloud service provider" in grey

Platform as a Service

PaaS provides environment in which to deploy your code

Details beneath your application are abstracted away

More efficient - code is executed (migrated onto CPU/memory) on request

No "dormant VM" or permanent infrastructure needed

Execution model is truly "on demand"

PaaS Application Model

Since no infrastructure, no maintaining service dependencies in your app

External support (SQL database, for ex.) provided by other (possibly web-based) services

Typically can bring language-native modules into application bundle

PaaS Service Offerings

Common for PaaS providers to offer in-house services to extend your app:

- Heroku https://elements.heroku.com/addons
- Google AppEngine - <u>https://cloud.google.com/appengine/appengine_servi</u> <u>ces</u>
- GE Predix https://www.predix.io/catalog/services/
- IBM Bluemix https://console.ng.bluemix.net/catalog/

SOA Revisited

Deploy small, funtionally-dedicated applications

Provision "instances" of services your application will utilize

Manage inter-service access control through private networking and/or public Internet

Building Applications I

Try it Yourself

Google AppEngine

- Install gcloud: <u>https://cloud.google.com/sdk/docs/</u>
- gcloud init
- Quick Start:

 https://slaud.google.com/adk/doogle.com/adk
 - https://cloud.google.com/sdk/docs/quickstarts
- Also install original "AppEngine" 1.9 bundle: https://cloud.google.com/appengine/docs/pyth-on/download
